## R tutorial

Meng Cao 2/1/2018

## Try R as a calculator:

```
1) 15 + 3

## [1] 18
2) \sqrt{4}

sqrt(4)

## [1] 2
3) 3 \times 15

3 * 15

## [1] 45
4) 7/3

7/3

## [1] 2.333333
5) 4^2

4~2

## [1] 16
```

## Binomial distribution with R:

1) Help Binomial

```
?Binomial
```

```
2) If X ~ Bernoulli (p = 0.5), calculate P(X = 1).
Use the following R function:
dbinom(x, size, prob, log = FALSE)
x: value we are interested in (in this example 1)
size: n, number of Bernoulli trails (in this example 1)
prob: probability of X = 1
dbinom(1, 1, 0.5)
```

```
## [1] 0.5
```

3) If  $X \sim \text{Binomial } (n = 10, p = 0.5), \text{ calculate } P(X = 2).$ 

```
n = 10
x = 2
p = 0.5
dbinom(x, n, p)
## [1] 0.04394531
choose(n, x) * (p)^x * (1 - p)^(n - x)
## [1] 0.04394531
  4) If X \sim \text{Binomial } (n = 10, p = 0.5), \text{ calculate } P(X \leq 2).
Use the following R function:
dbinom(x, size, prob, log = FALSE)
x: value we are interested in (in this example 2)
size: n, number of Bernoulli trails (in this example 10)
prob<br/>: probability of X=2
n = 10
x = 2
p = 0.5
pbinom(x, n, p)
## [1] 0.0546875
result = 0
for(ii in c(0:x)){
  result = result + choose(n, ii) * (p)^iii * (1 - p)^i(n - ii)
result
## [1] 0.0546875
  5) Bolts Example in Lesson 8:
X \sim \text{Binom}(n = 25, p = 0.05)
  a) P(X = 2)
n = 25
x = 2
p = 0.05
dbinom(x, n, p)
## [1] 0.2305177
  b) P(X \le 4)
n = 25
x = 4
p = 0.05
pbinom(x, n, p)
## [1] 0.9928351
  c) P(X > 4)
```

```
n = 25
x = 4
p = 0.05
1 - pbinom(x, n, p)
## [1] 0.007164948
  d) E[X] = n \times p
n = 25
p = 0.05
n*p
## [1] 1.25
SD(X) = \sqrt{n \times p \times (1-p)}
n = 25
p = 0.05
sqrt(n*p*(1-p))
## [1] 1.089725
  6) Medication: X \sim \text{Binom}(n = 12, p = 0.5)
  a) P(X \ge 11)
n = 12
x = 10
p = 0.5
1 - pbinom(x, n, p)
```

## ## [1] 0.003173828

b) No, it would be very unlikely to see this result for an ineffective medicine.
